

TEAM 4 - KENJI, YUXIN, WEIZHEN

SDRP DOMAIN NAME DISPUTES

OUTLINE OF PRESENTATION

- ▶ Objectives of Project
- ▶ Background Literature
- ▶ Methodology & Challenges
- ▶ Descriptive Analysis
- ▶ Modelling Analysis
- ▶ Conclusions

EXAMINATION AND EVALUATION OF THE SDRP FRAMEWORK IN SINGAPORE

- ▶ a) Compare and Contrast trends under the SDRP against other jurisdictions through descriptive statistics;
- ▶ b) Examine what are some of the salient factors (expressly stated or not in the SDRP) in affecting decisions under the SDRP (i.e which variable might have a greater weight in contributing to a domain name transfer);
- ▶ c) Evaluate some general criticisms against the UDRP framework and their relevance in the SDRP context
 - ▶ Identify if there are variables which might have operated on the minds of judges - that might not have been expressly stated in the judgment - that might have a huge correlation with the judgment: this has to do with the dummy variables

DOMAIN NAME SYSTEM

- ▶ Domain name is the textual address for a location on the Internet and correspond to IP addresses through the DNS (Domain Name system) which the computer recognises.
- ▶ A domain like "[nus.edu.sg](#)" has three components.
 - ▶ .sg is a Top Level Domain or TLD (in this case it is the ccTLD for Singapore)
 - ▶ .edu is a Second Level Domain (reflecting the nature of the organisation)
 - ▶ nus is the Third level Domain and this is what the organisation registers with the ".sg" domain name registry

DOMAIN NAME SYSTEM GOVERNANCE

- ▶ Internet Corporation for Assigned Names and Numbers ("ICANN") was formed as a non-profit, private sector organisation in Oct 1998 take over the day-to-day administration of the DNS from Internet Assigned Numbers Authority (IANA)
 - ▶ ICANN also coordinates the operation of the root name server system and responsible for making policies concerning the DNS.
 - ▶ But the responsibility of administration of ccTLDs are delegated to individual country managers who assume the role of registry operators and have full control over the operation of DNS service for their responsive ccTLDs.
- ▶ In Singapore, this is under the charge of Singapore Network Information Centre Private limited (SGNIC), a subsidiary of Infocomm Media Development Authority (IMDA)

DOMAIN NAME DISPUTES

- ▶ The explosive growth of the Internet and its users (7 million gTLD domain names in 1999 to 154 million gTLD & 123 million ccTLDs) make it extremely difficult to find attractive, short and generic terms to register as domain names.
- ▶ Domain names play a critical role in the marketplace, acting as central components of web addresses and email addresses.
- ▶ But domain names are usually issued on a “first come, first served” basis and are “unique” - the unique nature means that disputes over who is entitled to a particular domain name may arise where there are two or more parties interested in using the same domain name.
 - ▶ This created a disjunction between domain names and real world identifiers (e.g. trademarks) in which people have rights over.
 - ▶ This also created a possibility for opportunists to profit from the business goodwill or reputation in real world identifiers - i.e. the problem of cybersquatting or otherwise known as cyberpiracy.
 - ▶ This prompted the need for an administrative procedure and policy to be developed - Uniform Domain Name Dispute Resolution Policy (UDRP) as an alternative to court proceedings - designed to cater for the cybersquatting scenario and other instances of registration of domain names in bad faith.

DOMAIN NAME DISPUTES

- ▶ Singapore has not adopted the UDRP.
- ▶ Singapore Dispute Resolution Policy (SDRP) is incepted in 2001 for resolving domain disputes in Singapore as adopted by SGNIC for the .sg ccTLD.
 - ▶ SGNIC domain name registration agreements in force specifically provide that “any dispute over the registration and use of the domain name, unless resolved by ADR (incl. SDRP), should be adjudicated upon by the Singapore courts.
 - ▶ SDRP
 - ▶ Mediation as part of the dispute resolution mechanism
 - ▶ Three Main Elements that the Complainant must prove:
 - ▶ i) the Registrant’s domain name is identical or confusing similar to a name, trademark or service mark in which the Complainant has rights;
 - ▶ ii) the Registrant has no rights or legitimate interests in respect of the domain name; and
 - ▶ iii) the Registrant’s domain name has been registered or is being used in bad faith.
 - ▶ Remedy limited to requiring the cancellation of the Registrant’s domain name or the transfer of the Registrant’s domain name registration to the Complainant.

A high-angle, black and white photograph of a massive concrete dam. The dam's surface is composed of large, rectangular blocks with visible vertical joints. A single person stands on the top edge of the dam, providing a sense of scale to the enormous structure. The sky is a uniform, dark grey.

OVERCOMING CHALLENGES

METHODOLOGY

DATA

- ▶ SDRP decisions as main source of data
 - ▶ Obvious choice since we are analysing these decisions to spot patterns
 - ▶ Obtained from SDRP list of cases
 - ▶ 42 cases
 - ▶ Eliminated settled cases since they provided little room for analysis of how the SDRP panels made their decisions
 - ▶ 33 cases left – so we read 11 cases each

VARIABLES

- ▶ **63** variables – How can you possibly have 63 variables??
 - ▶ Many dependent variables
 - ▶ Variables that elaborated on other variables
 - ▶ Variables that were grounds of finding another variable
 - ▶ Not all variables were relevant – “more is more”?
 - ▶ Some overlaps in variables
 - ▶ E.g. “No response from Respondent” vs “Did Respondent respond?”

KEY VARIABLES: ELEMENTS OF THE TEST

1. Whether the Registrant's domain name is identical or confusingly similar to a name, trademark or service mark in which the Complainant has rights;
 - (a) Whether it was registered in other jurisdictions;
 - (b) Whether it was registered in Singapore;
 - (c) Number of years for which it has been registered both internationally and locally;
 - (d) Whether the mark was well-known; and
 - (e) The percentage similarity between the disputed domain name and the Complainant's word mark (if in existence).

-
2. Whether the Registrant has rights or legitimate interests in respect of the domain name;
- (a) Whether the Respondent showed usage / demonstrable preparations to use the domain name or name with bona fide offering of goods or services;
 - (b) Whether the Respondent showed that it was commonly known by the domain name;
 - (c) Whether the Respondent showed that it was making legitimate non-commercial or fair use of the domain name;
 - (d) The purpose for which the domain name was used; and
 - (e) The period for which the Respondent had been using the domain name (in years).

-
3. Whether the Complainant shows that the Registrant's domain name has been registered or is being used in bad faith
- (a) Whether circumstances indicated that the Registrant had registered or acquired the domain name primarily for valuable consideration in excess of the Registrant's documented out-of-pocket costs directly related to the domain name;
 - (b) Whether the Registrant had registered the domain name in order to prevent the Complainant from reflecting the mark in a corresponding domain name, provided that the Registrant has engaged in a pattern of such conduct;
 - (c) Whether the Registrant had registered the domain name primarily for the purpose of disrupting the business of a competitor; and
 - (d) Whether the Registrant had intentionally attempted to attract, for commercial gain, Internet users to the Registrant's website or other on-line location, by creating a likelihood of confusion with the Complainant's name or mark using the domain name.

DUMMY VARIABLES

- ▶ Why include dummy variables?
 - ▶ Could possibly shed light on thought process of SDRP panels – possibility of factors not mentioned in decisions that do affect the conclusion
- ▶ Did the dummy variables actually help? – No
 - ▶ Often difficult to extract these variables
 - ▶ Not available from given facts
 - ▶ Legal findings on which we were unqualified to draw our own conclusions
 - ▶ Where dummy variables could be extracted, rarely useful
 - ▶ So obvious that they could be derived from the key elements from before
 - ▶ So obvious that they returned the same results for most, if not all, of the dataset (see screenshot csv)

DUMMY VARIABLES

- ▶ Complainant's rights over domain name:
 - ▶ Made_up_word; English_word;
 - ▶ Length_of_word; Domain_a_variation_on_mark_or_brand;
 - ▶ Similar_words; Percentage_of_Similarity_of_Words; Pronunciation_Similarity;
 - ▶ Abandonment_by_Complainant
- ▶ Other grounds of bad faith:
 - ▶ Respondent_Attempt_to_sell;
 - ▶ Prior_Commercial_relationship_between_parties;
 - ▶ Attempts_to_settle; Number_of_settle_attempts;
 - ▶ Mediation_prior; Mediation_Prior_attempts

- ▶ Procedural aspect of decisions of decisions:
 - ▶ Length_of_Cases_in_months;
 - ▶ Country_of_Respondent; Country_of_Complainant;
Industry_Complainant;
 - ▶ Industry_Registrant
- ▶ Others:
 - ▶ No_Cited_SG_Cases; No_Cited_SDRP_cases; No_Cited_UK_EU_cases;
No_Cited_US_Cases; No_Cited_WIPO_UDRP_cases;
 - ▶ Panelist; Panelist_Type;
 - ▶ No_response_from_respondent

ATTRIBUTING VALUES TO VARIABLES

- ▶ For binary variables:
 - ▶ Yes: 1; No: -1; Not mentioned: 0
- ▶ For quantitative variables
 - ▶ Attention to detail matters – e.g. months or years?
- ▶ What to do when data is unavailable? Esp. for dummy variables
 - ▶ Leaving out data point further reduces already scarce dataset
 - ▶ Where everything is 'not mentioned' in the large part of the dataset, little use for particular variable

DATA PROCESSING

- ▶ Categorical variables:

```
dataSet['Usage_of_Domain_name'] = dataSet['Usage_of_Domain_name'].astype('category')
dataSet['Panelist_Type'] = dataSet['Panelist_Type'].astype('category')
dataSet['Country_of_Respondent'] = dataSet['Country_of_Respondent'].astype('category')
dataSet['Country_of_Complainant'] = dataSet['Country_of_Complainant'].astype('category')
dataSet['Industry_Complainant'] = dataSet['Industry_Complainant'].astype('category')
dataSet['Industry_Registrant'] = dataSet['Industry_Registrant'].astype('category')
dataSet['Panelist'] = dataSet['Panelist'].astype('category')
dataSet['Year_of_Judgment'] = dataSet['Year_of_Judgment'].astype('category')
```

- ▶ Failure to change data type of categorical variables led to lower R-squared results
- ▶ Why? Equivalent of arbitrarily/poorly assigning values to ordinal variables

WORKING WITH 63 VARIABLES

- ▶ Was there a need for 63 variables?
- ▶ Did we use all 63 variables?
- ▶ Far messier and more tedious than probably necessary
 - ▶ Repeated / very similar variables
 - ▶ Inconsistent calibration of data
 - ▶ Re-reading of cases to fill up endlessly increasing columns

MODELLING

- ▶ At what point does more become too much?
- ▶ Trial and error – more variables, more trial, more error
- ▶ Because of the number of variables we had, we ended up modelling separately on overall models and sub-models based on each element of the test
 - ▶ What is the significance of this?
 - ▶ Do we need that many models?
 - ▶ Does it aid us in finding legally significant conclusions?

▶ Linear regression
 with 33 data points,
 16 variables – **R = 1**?

CHALLENGES

- ▶ Small dataset
 - ▶ Only 33 SDRP cases to work with
 - ▶ Dataset only available from 2002
- ▶ Foreign jurisdictions – How helpful?
 - ▶ WIPO
 - ▶ UK Nominet – rejected FOI request :(
 - ▶ Salient cases in guidebook? How helpful is this?

DESCRIPTIVE STATISTICS

**“STATISTICS IS THE GRAMMAR OF SCIENCE”
– KARL PEARSON**

- Number of Domain Registrations
- Growth Rate (year on year)

DESCRIPTIVE ANALYSIS

1. Number of Cases over the years
2. CyberSquatting Ratio
3. Proportion of Cases decided in favour of Complainant
4. Default Rate
5. Number of Precedents Cited

1) NUMBER OF CASES OVER THE YEARS

- ▶ The histogram here tracks the number of cases (by decisions) against the year of judgment.
 - ▶ Note: This data includes the cases which are settled for calculation of Cybersquatting ratio later
- ▶ Evaluation:
 - ▶ The numbers of cases over the years since the adoption of SDRP in Singapore has been fairly constant although there has been a pickup in the last 2 years.
 - ▶ A few hypothesis may be made here:
 - ▶ a) The lack of cybersquatting in Singapore (which is more appropriately analysed using the cybersquatting ratio)
 - ▶ b) The reluctance to pursue a case under SDRP because of i) costs (i.e. cheaper to just buy the domain from the person), ii) lack of publicity, iii) availability of alternative TLDs to achieve the same purpose.

Number of SDRP
Complaints

2) CYBERSQUATTING RATIO

- ▶ Cybersquatting ratio is defined as total number of disputed domain names with the respective registration yields

Country	Australia (by Feb 2017)	Canada (by Dec 2014)	Singapore (by Feb 2017)	UK (by Dec 2015)
Complaints (By Jan 2017)	539	274	42	11,124
Total Number of Registrations	6,167,996	2,134,590	175,869	10,140,436
CyberSquatting Ratio	0.00874%	0.01284%	0.02389%	0.10970%

- ▶ Evaluation: WIPO in its report uses CyberSquatting Ratio to examine the level of abusive registrations.
 - ▶ In the present case, it would appear that Singapore has the highest CyberSquatting Ratio amongst the three jurisdictions/systems.
 - ▶ (Although it ought to be noted that the data from the other two jurisdictions are not up-to-date and recent statistics may indicate otherwise)

3) PROPORTION OF CASES DECIDED IN FAVOUR OF COMPLAINANT

- ▶ Evaluation: According to WIPO (based on their report), the higher success rate of the Complainants may indicate a higher level of abusive registrations.
 - ▶ In line with the CyberSquatting Ratio statistic earlier, the high rate of successful cases in Singapore will seem to similarly indicate a higher incidence of abusive registration in Singapore.

4) DEFAULT RATE

► Evaluation:

- When a Respondent does not provide a response, it usually infers that the Respondent did not see any point in defending the domain name.
 - The alternative possibility that the respondent did not receive notice is highly unlikely.
- Therefore, the high default rate seems to similarly indicate the high incidence of cybersquatting in Singapore as well.
- Side Note: The high rate of default is consistent across other jurisdictions with a similar *ex post* system (i.e. UK with about 70% default rate) as compared to jurisdictions with an *ex ante* system (i.e. Australia with about 24.6%)
 - Ex Ante: Restrictive Registration System
 - Ex Post: Unrestrictive Registration System

- No Response From Respondent
- Respondent Responded

5) NUMBER OF PRECEDENTS CITED PER CASE

5) NUMBER OF PRECEDENTS CITED

■ Average Number of Precedents Cited Per Case
— Polynomial Trend Line

5) NUMBER OF PRECEDENTS CITED

► Observations:

- A consistent observation throughout is the huge influence by UDRP cases which is to be well-expected given the similarity between SDRP and the huge body of case-law in UDRP cases
- Secondly, the number of SDRP cases cited as precedents have also risen in absolute numbers over the years given that the body of case law in Singapore is growing as well, although the average number has remained consistently low.
- The increasing usage of precedents is perhaps one healthy indicator of the consistency amongst cases decided under the SDRP given that a major criticism of the UDRP/SDRP system is the lack of consistency amongst cases. This criticism is based very much on the non-adoption of the stare decisis principle in the UDRP/SDRP system where some of the SDRP cases did not refer to any case precedents in coming to the decision.

INTERIM CONCLUSIONS

- ▶ 1) There appears to be a growing number of cases in Singapore in the recent years and this may be attributed to the increasing usage of the Internet in Singapore by SMEs.
- ▶ 2) The small number of cases under the SDRP does not mean that there is small incidence of CyberSquatting in Singapore. On the contrary, the other statistics (i.e. default rate, cybersquatting ratio and proportion of cases decided in favour of complainant) suggest that Singapore has a relatively high number of CyberSquatting.
- ▶ 3) The growing number of case precedents in Singapore seem to be a healthy indicator of consistency amongst SDRP cases even though there is no strict requirement for stare decisis under the SDRP.

MODELS:

A SEARCH FOR
THE PERFECT FIT

MAIN OBJECTIVES:

- identify which variables might have a greater weight in contributing to a domain name transfer
- which variables may contribute to a finding of each element
- Identify if there are variables which might have operated on the minds of judges - that might not have been expressly stated in the judgment - that might have a huge correlation with the judgment: this has to do with the dummy variables we created

OBJECTIVES:

CHALLENGES

● Small Data Set:

- ▶ Affects the ability to create a model that makes sensible predictions (e.g. Model against Panelists)

● Logistic Regression:

- ▶ technically, categorical variables, logistic regression should work
- ▶ BUT: we faced these errors:
 - ▶ *"perfect separation" // "ConvergenceWarning: Maximum Likelihood optimization failed to converge. Check mle_retvals"*
 - ▶ *Endog must be in unit interval -> we had to recalibrate data (as will be explained when the model comes)*

MODELLING ANALYSIS – 4 TYPES OF MODELS

- ▶ **Sub-Models for Each of the 3 Sub-Elements:**
 - ▶ Sub-Model 1: Similarity / Confusing Similarity of Domain Name & Mark
 - ▶ Sub-Model 2: Complainant has proven that Respondent has no Legitimate Interest in the Domain Name
 - ▶ Sub-Model 3: Complainant has proven that Respondent has registered or used the Domain Name in Bad Faith
- ▶ **General Model:** Modelling the Conclusion against variables under each of the 3 sub-elements

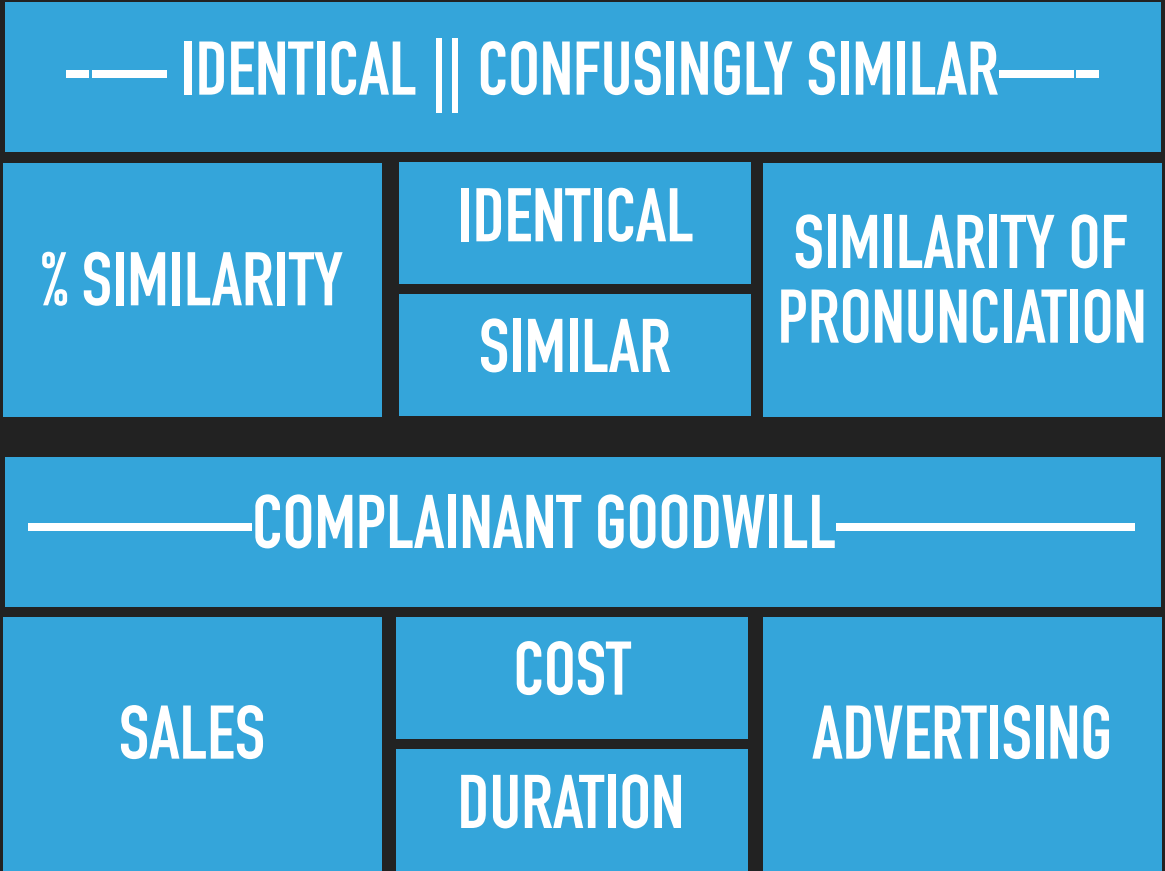

SUB-MODEL 1: IDENTICAL / CONFUSING SIMILARITY

CHOICE OF VARIABLES

LINEAR MODEL

LOGISTIC MODEL

(1) IDENTICAL/CONFUSING SIMILARITY: VARIABLES TO CHOOSE FROM
